

Take-Home Quiz #7

(SOLUTIONS)

1. This problem had a typo! The differential equation should read

$$x^2 y'' + xy' + (x^2 - p^2)y = 0.$$

(a) Differentiate the Bessel function term-by-term:

$$J'_p(x) = \sum_{k=0}^{\infty} \underbrace{\frac{(-1)^k}{k!(k+p)! 2^{2k+p}}}_{\text{coefficient}} \underbrace{(2k+p)x^{(2k+p)-1}}_{\text{power rule}}$$

$$J''_p(x) = \sum_{k=0}^{\infty} \frac{(-1)^k (2k+p)(2k+p-1)}{k!(k+p)! 2^{2k+p}} x^{2k+p-2}$$

Substitute these expressions into the differential equation.

$$\begin{aligned} & x^2 \left(\sum_{k=0}^{\infty} \frac{(-1)^k (2k+p)(2k+p-1)}{k!(k+p)! 2^{2k+p}} x^{2k+p-2} \right) + x \left(\sum_{k=0}^{\infty} \frac{(-1)^k (2k+1)}{k!(k+p)! 2^{2k+p}} x^{2k+p-1} \right) \\ & + (x^2 - p^2) \left(\sum_{k=0}^{\infty} \frac{(-1)^k}{k!(k+p)! 2^{2k+p}} x^{2k+p} \right) \\ & = \sum_{k=0}^{\infty} \frac{(-1)^k (2k+p)(2k+p-1)}{k!(k+p)! 2^{2k+p}} x^{2k+p} + \sum_{k=0}^{\infty} \frac{(-1)^k (2k+1)}{k!(k+p)! 2^{2k+p}} x^{2k+p} \\ & + \sum_{k=0}^{\infty} \frac{(-1)^k (x^2 - p^2)}{k!(k+p)! 2^{2k+p}} x^{2k+p} \end{aligned}$$

$$= \sum_{k=0}^{\infty} \frac{(-1)^k}{k!(k+p)!2^{2k+p}} \left(\underbrace{(2k+p)(2k+p-1) + (2k+p) + (x^2 - p^2)}_{(2k+p)(2k+p-1+1) = 4k^2 + 4kp + p^2} \right) x^{2k+p}$$

$$= \sum_{k=0}^{\infty} \frac{(-1)^k (4k^2 + 4kp + x^2)}{k!(k+p)!2^{2k+p}} x^{2k+p}$$

Claim This is a telescoping series. Look at the partial sums:

$$S_1 = (-1)^0 \left(\frac{4(0)^2 + 4(0)p + x^2}{0!(0+p)!2^{2(0)+p}} \right) x^{2(0)+p} + (-1)^1 \left(\frac{4(1)^2 + 4(1)p + x^2}{1!(1+p)!2^{2(1)+p}} \right) x^{2(1)+p}$$

$$= \frac{1}{p!2^p} x^{2+p} - \left(\frac{4 + 4p + x^2}{(1+p)!2^{2+p}} \right) x^{2+p}$$

$$= \frac{(1+p) \cdot 2^2}{(1+p)!2^{2+p}} x^{2+p} - \frac{4 + 4p + x^2}{(1+p)!2^{2+p}} x^{2+p} = -\frac{1}{(1+p)!2^{2+p}} x^{4+p}$$

$$S_2 = S_1 + \frac{(-1)^2 (4(2)^2 + 4(2)p + x^2)}{2!(2+p)!2^{2(2)+p}} x^{2(2)+p}$$

$$= \frac{-1}{(1+p)!2^{2+p}} x^{4+p} + \frac{16 + 8p + x^2}{2!(2+p)!2^{4+p}} x^{4+p}$$

$$= -\frac{2!(2+p) \cdot 2^2}{2!(2+p)!2^{4+p}} x^{4+p} + \frac{16 + 8p + x^2}{2!(2+p)!2^{4+p}} x^{4+p} = \frac{1}{2!(2+p)!2^{4+p}} x^{6+p}$$

$$\vdots$$

$$S_n = \frac{(-1)^n}{n!(n+p)!2^{2n+p}} x^{2(n+1)+p}$$

→

The series is $\lim_{n \rightarrow \infty} \frac{(-1)^n}{n!(n+p)! 2^{2n+p}} x^{2(n+1)+p} = 0$, as

desired, since factorial functions dominate exponential functions.

$$\begin{aligned}
 (b) \lim_{k \rightarrow \infty} \frac{\frac{|x|^{2(k+1)+p}}{(k+1)!(k+1+p)! 2^{2(k+1)+p}}}{\frac{|x|^{2k+p}}{k!(k+p)! 2^{2k+p}}} &= \lim_{k \rightarrow \infty} \frac{|x|^2}{(k+1)(k+1+p) \cdot 4} \\
 &= \frac{|x|^2}{4} \lim_{k \rightarrow \infty} \frac{1}{(k+1)(k+1+p)}
 \end{aligned}$$

$= 0$ for all x .

$\Rightarrow J_p(x)$ converges for all $x \in \mathbb{R}$.

(c) - see attached -

$p=0$

$$\begin{aligned}
 S_0 &= \frac{(-1)^0}{0!(0-p)! \cdot 2^{(2(0)-p)} x^{(2(0)-p)}} \\
 S_1 &= S_0 + \frac{(-1)^1}{1!(1-p)! \cdot 2^{(2(1)-p)} x^{(2(1)-p)}} \\
 S_2 &= S_1 + \frac{(-1)^2}{2!(2-p)! \cdot 2^{(2(2)-p)} x^{(2(2)-p)}} \\
 S_3 &= S_2 + \frac{(-1)^3}{3!(3-p)! \cdot 2^{(2(3)-p)} x^{(2(3)-p)}} \\
 S_4 &= S_3 + \frac{(-1)^4}{4!(4-p)! \cdot 2^{(2(4)-p)} x^{(2(4)-p)}} \\
 S_5 &= S_4 + \frac{(-1)^5}{5!(5-p)! \cdot 2^{(2(5)-p)} x^{(2(5)-p)}} \\
 S_6 &= S_5 + \frac{(-1)^6}{6!(6-p)! \cdot 2^{(2(6)-p)} x^{(2(6)-p)}} \\
 S_7 &= S_6 + \frac{(-1)^7}{7!(7-p)! \cdot 2^{(2(7)-p)} x^{(2(7)-p)}} \\

$$S_9 = S_8 = \frac{(-1)^9}{9!(9-p)! \cdot 2^{(3-9)}} = -\frac{1}{9! \cdot 2^6}$$

$$2. f(x) = \sqrt{x} \Rightarrow f'(x) = \frac{1}{2}(x)^{-1/2}$$

$$f''(x) = \frac{1}{2} \left(-\frac{1}{2} \right) x^{-3/2}$$

$$f'''(x) = \frac{1}{2} \left(-\frac{1}{2} \right) \left(-\frac{3}{2} \right) x^{-5/2}$$

$$f^{(4)}(x) = \frac{1}{2} \left(-\frac{1}{2} \right) \left(-\frac{3}{2} \right) \left(-\frac{5}{2} \right) x^{-7/2}$$

$$(a) P_4(x) = f(1) + f'(1)(x-1) + \frac{f''(1)}{2}(x-1)^2 + \frac{f'''(1)}{3!}(x-1)^3 + \frac{f^{(4)}(1)}{4!}(x-1)^4$$

$$= 1 + \frac{1}{2}(x-1) + \frac{\frac{1}{2} \left(-\frac{1}{2} \right)}{2}(x-1)^2 + \frac{\left(\frac{1}{2} \right) \left(-\frac{1}{2} \right) \left(-\frac{3}{2} \right)}{3!}(x-1)^3 + \frac{\left(\frac{1}{2} \right) \left(-\frac{1}{2} \right) \left(-\frac{3}{2} \right) \left(-\frac{5}{2} \right)}{4!}(x-1)^4$$

$$(b) P(x) = 1 + \sum_{k=1}^{\infty} \frac{\left(\frac{1}{2} \right) \left(-\frac{1}{2} \right) \cdots \left(\frac{1}{2} - k + 1 \right)}{k!} (x-1)^k$$

$$\text{or } \left| 1 + \sum_{k=1}^{\infty} \binom{\frac{1}{2}}{k} (x-1)^k \right|$$

→

(c) Write $R_n(x) = \frac{\left(\frac{1}{2}\right)\left(-\frac{1}{2}\right)\left(-\frac{3}{2}\right)\left(-\frac{5}{2}\right) \cdots \left(\frac{1}{2}-n\right)}{(n+1)!} c^{\frac{1}{2}-n-1} (x-1)^{n+1}$

$$= \frac{(-1)^n (1 \cdot 3 \cdot 5 \cdots (2n-1)) \sqrt{c}}{(n+1)! (2c)^{n+1}} (x-1)^{n+1}$$

$$\Rightarrow \lim_{n \rightarrow \infty} R_n(x) = \sqrt{c} \left(\lim_{n \rightarrow \infty} \frac{1 \cdot 3 \cdot 5 \cdots (2n-1)}{(n+1)!} \right) \left(\lim_{n \rightarrow \infty} \frac{(-1)^n}{(2c)^{n+1}} \right) \left(\lim_{n \rightarrow \infty} (x-1)^{n+1} \right)$$

Note that $x \in \left(\frac{1}{2}, \frac{3}{2}\right)$ and $c \in (1, x)$. In particular,

$$2c > 1 \Rightarrow (2c)^{n+1} \rightarrow \infty \text{ as } n \rightarrow \infty \text{ and}$$

$$|x-1| < 1 \Rightarrow (x-1)^{n+1} \rightarrow 0 \text{ as } n \rightarrow \infty.$$

The limit becomes

$$\sqrt{c} \left(\lim_{n \rightarrow \infty} \frac{1 \cdot 3 \cdot 5 \cdots (2n-1)}{(n+1)!} \right) (0)(0) = 0$$

2 by the Ratio Test:

$$\frac{\frac{1 \cdot 3 \cdot 5 \cdots (2n+1-1)}{((n+1)+1)!}}{\frac{1 \cdot 3 \cdot 5 \cdots (2n-1)}{(n+1)!}} = \frac{2n+1}{n+2} \rightarrow 2 \text{ as } n \rightarrow \infty$$

Since the limit equals 0 when $x \in \left(\frac{1}{2}, \frac{3}{2}\right)$, $f(x)$ must equal its Taylor series on that interval.

$$3. (a) P(x) = 9x \sum_{k=0}^{\infty} \left(\frac{x^2}{9}\right)^k = \sum_{k=0}^{\infty} 9x \frac{x^{2k}}{9^k}$$

$$\left[\sum_{k=0}^{\infty} \frac{x^{2k+1}}{9^{k-1}} \right]$$

(b) Since the interval of convergence for $\frac{1}{1-x}$ is $(-1, 1)$, we must have $\frac{x^2}{9} \in (-1, 1)$

$$\Rightarrow x^2 \in (-9, 9)$$

$$\Rightarrow \boxed{x \in (-3, 3)}$$

$$4. (a) P(x) = \left[\ln\left(\frac{1}{4}\right) + \sum_{k=1}^{\infty} \frac{(-1)^{k+1}}{k} \left(\frac{x^2}{4}\right)^k \right]$$

Since $\frac{x^2}{4} \in (-1, 1]$, the interval of convergence

$$\Rightarrow x^2 \in (-4, 4] \quad \text{is} \quad \boxed{x \in [-2, 2]}$$

$$(b) \int_{0.5}^1 \left(\ln \frac{1}{4} + \sum_{k=1}^{\infty} \frac{(-1)^{k+1}}{k} \left(\frac{x^2}{4}\right)^k \right) dx$$

$$= \ln\left(\frac{1}{4}\right)x \Big|_{0.5}^1 + \sum_{k=1}^{\infty} \frac{(-1)^{k+1}}{k \cdot 4^k} \int_{0.5}^1 x^{2k} dx$$

$$= \left(\ln \frac{1}{4} - \frac{1}{2} \ln \frac{1}{4} \right) + \sum_{k=1}^{\infty} \frac{(-1)^{k+1}}{4^k k} \frac{x^{2k+1}}{2k+1} \Big|_{0.5}^1$$

$$= \frac{1}{2} \ln \frac{1}{4} + \sum_{k=1}^{\infty} \frac{(-1)^{k+1}}{4^k k(2k+1)} \left(1^{2k+1} - \left(\frac{1}{2}\right)^{2k+1} \right)$$

$$= \ln\left(\frac{1}{2}\right) + \sum_{k=1}^{\infty} \frac{(-1)^{k+1} (-1)^{2k+1}}{2^{2k} k(2k+1) 2^{2k+1}}$$

$$\left| \ln\left(\frac{1}{2}\right) + \sum_{k=1}^{\infty} \frac{(-1)^{3k+2}}{k(2k+1) 2^{4k+1}} \right|$$
